Population screening explained

Screening is the process of identifying healthy people who may have an increased chance of a disease or condition. It can be helpful to think of screening like a sieve.

The sieve represents the screening test and most people pass through it. This means they have a low chance of having the condition screened for.

The people left in the sieve have a higher chance of having the condition. The screening provider can then offer them information, further tests or treatment as appropriate.

Personal choice

All screening is a balance of potential benefits and potential harms.

Deciding whether or not to have a screening test is a personal choice and one which only you can make. You have the right to accept or decline screening.

At each stage of the screening process, you can make your own choices about any further tests, treatment, advice and support.

Short animations which explain more about screening.
